PySpark lit() – Add Literal or Constant to DataFrame

PySpark / SQL functions lit() and typedLit() are used to add a new column to DataFrame by assigning a literal or constant value. Both these functions return Column type (https://sparkbyexamples.com/pyspark/pyspark-column-functions/) as return type.

```
import pyspark
from pyspark.sql import SparkSession

spark = SparkSession.builder.appName('Example1').getOrCreate()
data = [("111", 50000), ("222", 60000)]
columns = ["EmpId", "Salary"]
df = spark.createDataFrame(data = data, schema = columns)
```

lit() Function to Add Constant Column

PySpark lit() function is used to add constant or literal value as a new column to the DataFrame.

Creates a [[Column]] of literal value. The passed in object is returned directly if it is already a [[Column]]. If the object is a Scala Symbol, it is converted into a [[Column]] also. Otherwise, a new [[Column]] is created to represent the literal value

Let's take a look at some examples.

Succeed online

in.godaddy.com

Example 1: Simple usage of lit() function

Let's see an example of how to create a new column with constant value using lit() Spark SQL function (<https://sparkbyexamples.com/spark/sql-functions-understanding/>). On the below snippet, we are creating a new column by adding a literal '1' to PySpark DataFrame.

```
from pyspark.sql.functions import lit
df2 = df.select(col("EmpId"), col("Salary"), lit(1).alias("NewColumn"))
df2.show(truncate=False)
```

(<https://sparkbyexamples.com/pyspark/pyspark-pivot-and-unpivot-dataframe/>)

[PySpark – partitionBy\(\)](#)
(<https://sparkbyexamples.com/pyspark/pyspark-partitionby-example/>)

[PySpark – ArrayType Column \(Array\)](#)
(<https://sparkbyexamples.com/pyspark/pyspark-arraytype-column-with-examples/>)

```
+-----+-----+-----+
|EmpId|Salary|lit_value1|
+-----+-----+-----+
|  111| 50000|          1|
|  222| 60000|          1|
|  333| 40000|          1|
+-----+-----+-----+
```

Adding the same constant literal to all records in DataFrame may not be real-time useful so let's see another example.

Example 2 : lit() function with withColumn

The following example shows how to use pyspark lit() function using withColumn to derive a new column based on some conditions.

```
from pyspark.sql.functions import lit
df3 = df2.withColumn("lit_value2", lit(100))
df3.show(truncate=False)
```

Below is the output for the above code snippet.

```
+-----+-----+-----+-----+
|EmpId|Salary|lit_value1|lit_value2|
+-----+-----+-----+-----+
|  111| 50000|          1|        100|
|  222| 60000|          1|        200|
|  333| 40000|          1|        100|
+-----+-----+-----+-----+
```

typedLit() Function – Syntax

Difference between lit() and typedLit() is that, typedLit function can handle collection types e.g.: Array, Dictionary(map) e.t.c

[PySpark – MapType \(Map/Dict\)](https://sparkbyexamples.com/pyspark/pyspark-maptype-dict-examples/)
(<https://sparkbyexamples.com/pyspark/pyspark-maptype-dict-examples/>).

in.godaddy.com

Complete Example of How to Add Constant Column

```
import pyspark
from pyspark.sql import SparkSession

spark = SparkSession.builder.appName("Example").getOrCreate()
data = [("111", 50000), ("222", 60000)]
columns = ["EmpId", "Salary"]
df = spark.createDataFrame(data = data, schema = columns)
df.printSchema()
df.show(truncate=False)

from pyspark.sql.functions import lit
df2 = df.select(col("EmpId"), col("Salary"), lit(100))
df2.show(truncate=False)

from pyspark.sql.functions import typedLit
df3 = df2.withColumn("lit_value2", typedLit(100))
df3.show(truncate=False)
```

Conclusion:

You have learned multiple ways to add a constant literal value to DataFrame using PySpark `lit()` function and have learned the difference between `lit` and `typedLit` functions.

When possible try to use predefined PySpark functions as they are a little bit more compile-time safety and perform better when compared to user-defined functions. If your application is critical on performance try to avoid using custom UDF functions as these are not guarantee on performance.

Happy Learning !!
